LEAD GENERATION IN A BOX.

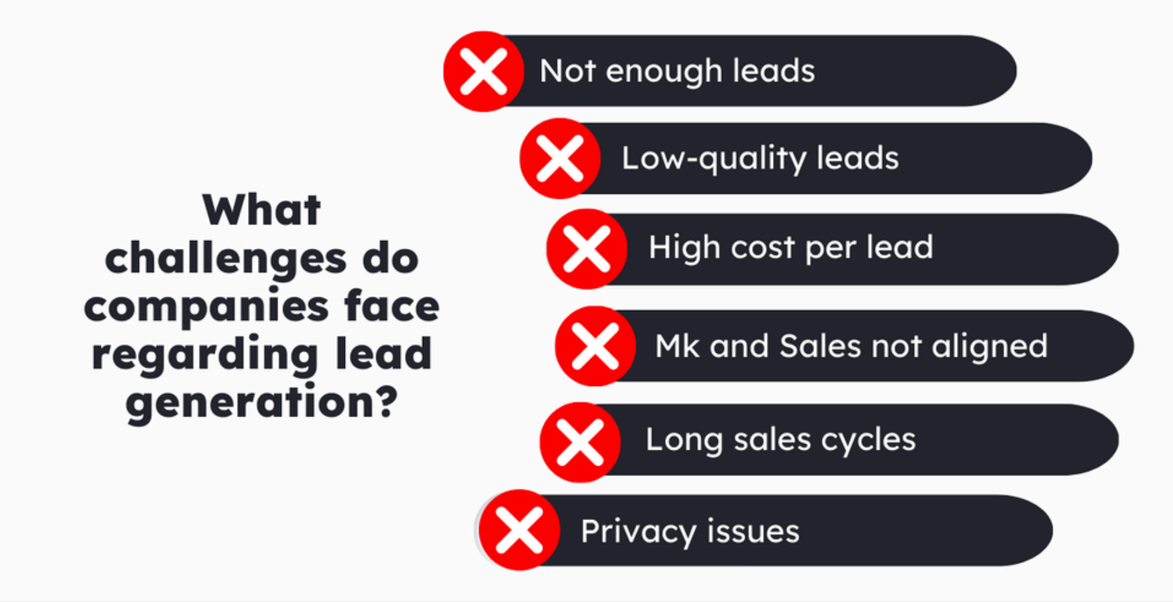

AUTOMATED INFRASTRUCTURE

Designed & Architected by
Karan Paliwal

An end-to-end autonomous pipeline that turns a single keyword into a fully researched, enriched, and outreach-ready lead in minutes.

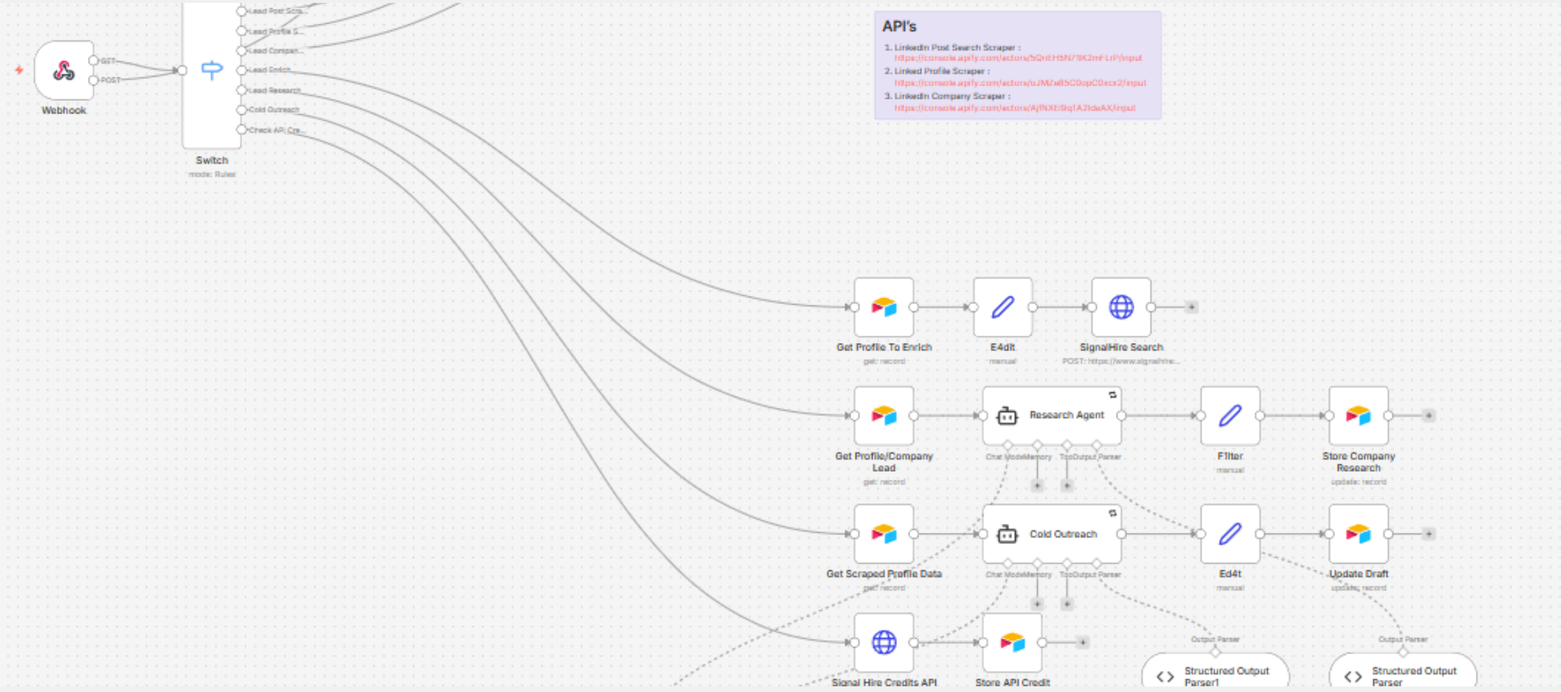

THE HIDDEN COST OF MANUAL PROSPECTING.

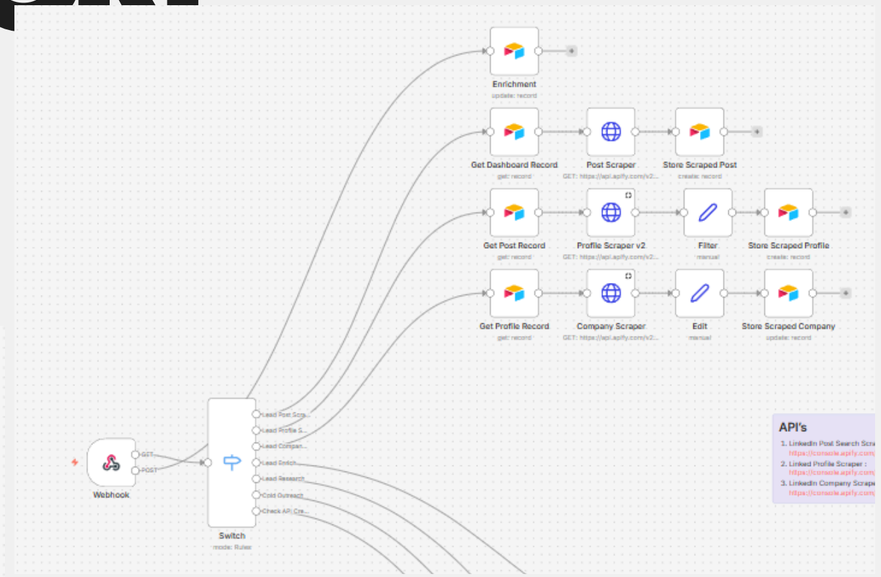

Most sales teams don't struggle to find prospects. They struggle to turn them into conversations. One day they search LinkedIn, nothing relevant. Next day they try email tools, no context. Different platforms, different data, no unified pipeline. So outreach becomes generic instead of personalized. Teams solve this by hiring more people. We wondered: Can a system do all of this automatically?

THE ENGINE: A PIPELINE THAT RESEARCHES BEFORE IT REACHES OUT

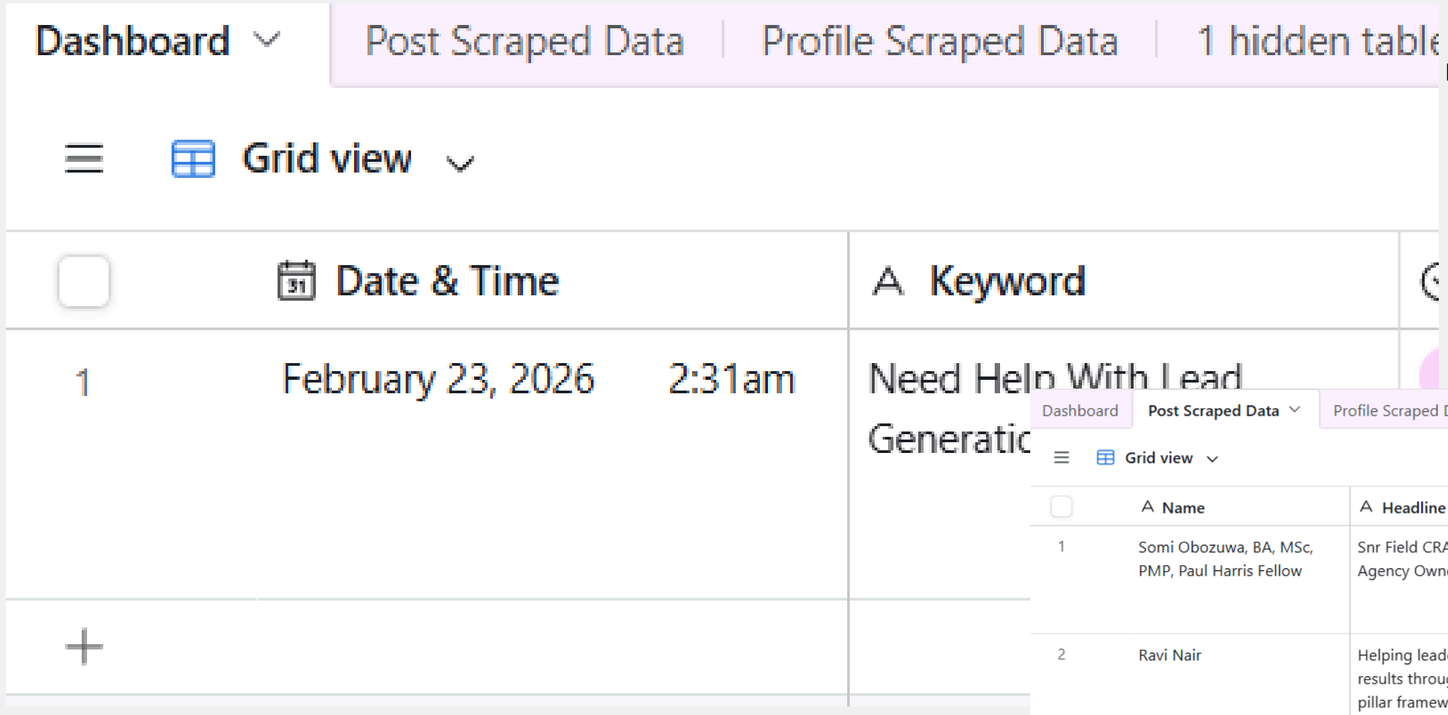

The system doesn't send a message the moment it finds a name. It first scrapes the prospect's actual LinkedIn post, reads their company, identifies their real pain points, and only then constructs a personalized outreach draft. This mimics how a senior sales rep operates: understand first, speak second.

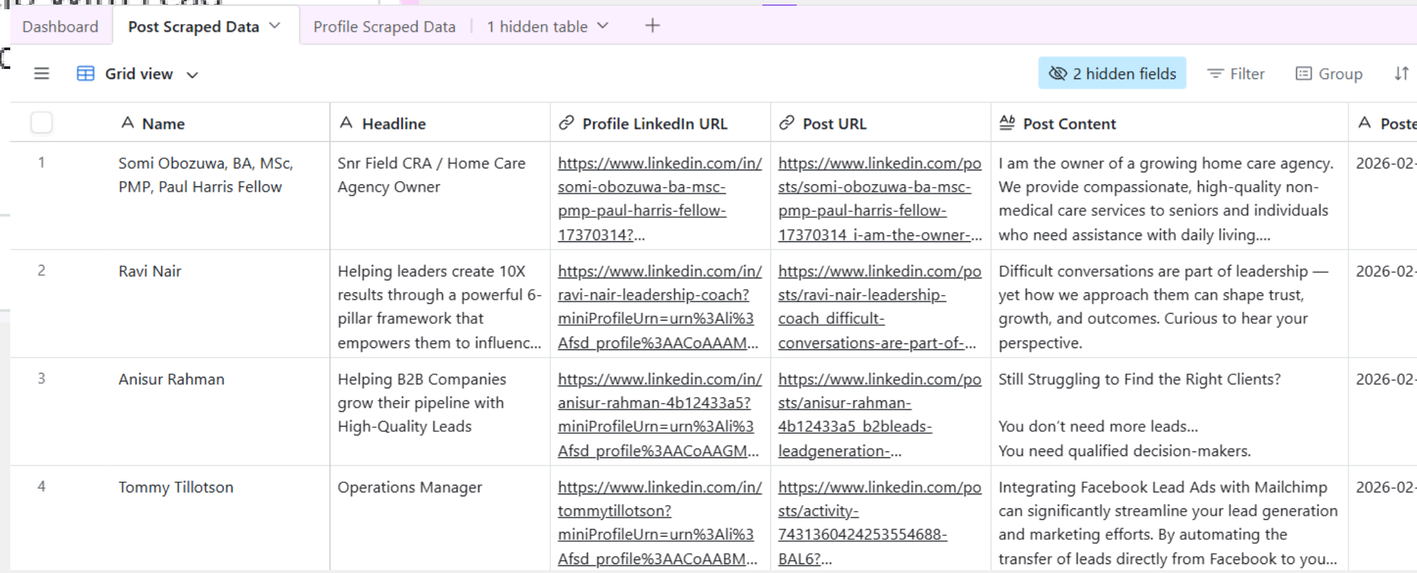

Pipeline Flow:

- User enters keyword on dashboard
- System pulls live LinkedIn posts matching intent
- Profile and company scraped in real time
- AI research agent identifies pain points and business context
- Enrichment layer finds verified email and phone
- Outreach drafted using full prospect context, not templates

The system is not a generator. It is a planner that thinks before it speaks.

THE MEMORY LAYER: EVERY LEAD, EVERY DETAIL, NEVER LOST.

Most automation tools execute and forget. Every time you run them, they start from zero. This system keeps a structured record of every prospect it touches, the LinkedIn post that triggered discovery, the company pain points it identified, the enrichment data it found, and the outreach draft it generated. The pipeline does not just run. It remembers.

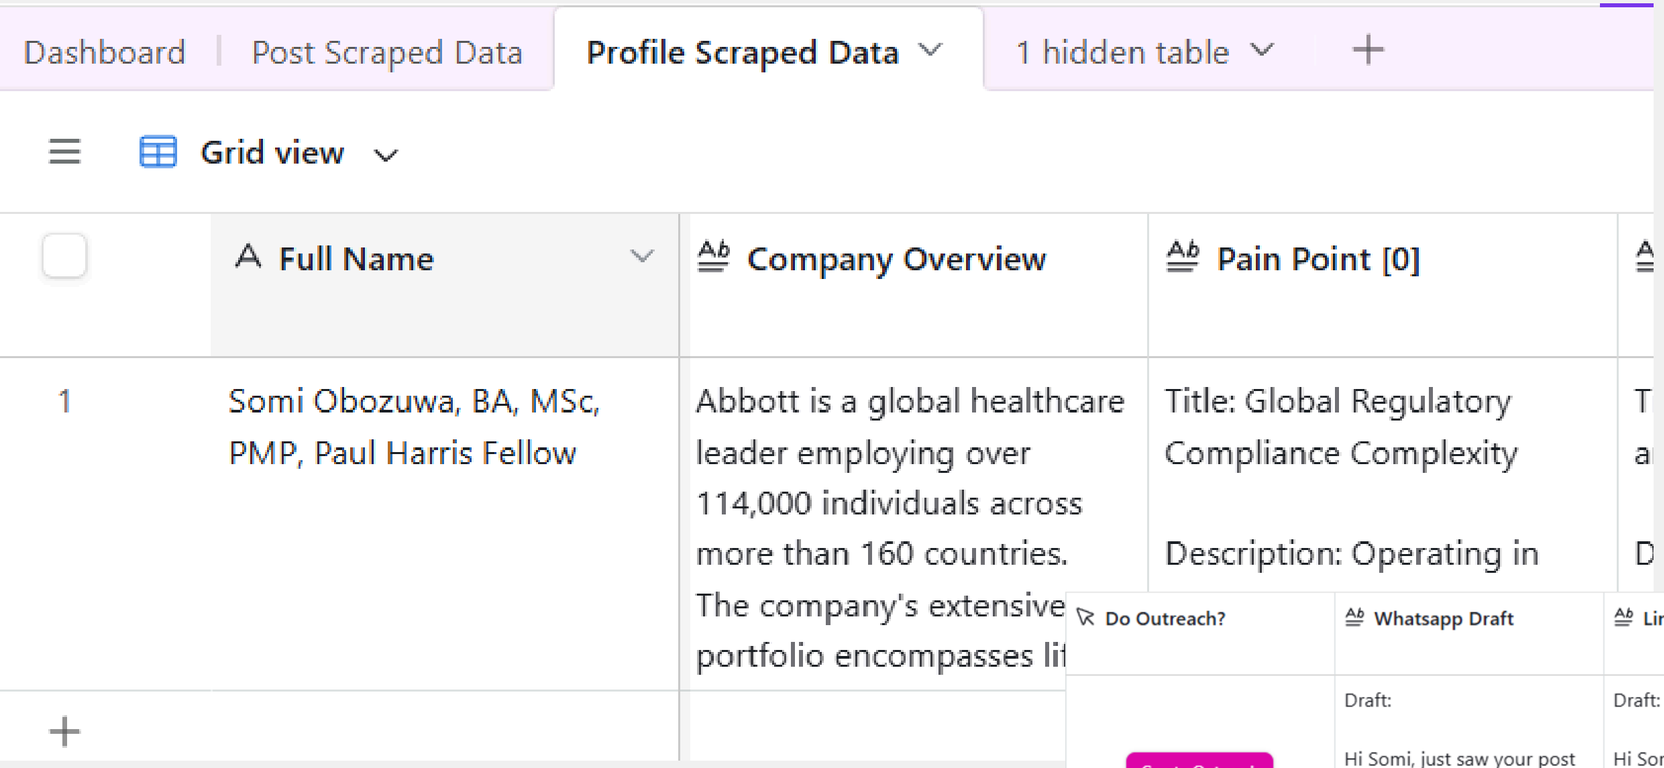

What the database handles:

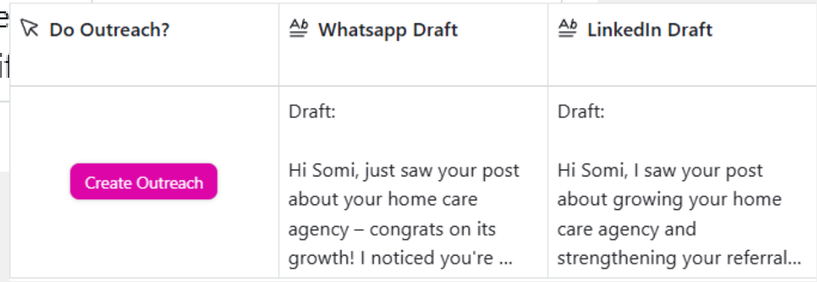

- Stores every scraped post and prospect profile
- Saves deep company research and identified pain points
- Tracks enrichment data including verified emails and phone numbers
- Logs generated outreach drafts for LinkedIn and WhatsApp
- Maintains full prospect history so nothing is ever duplicated

Consistency comes from memory, not prompts.

FROM KEYWORD TO OUTREACH READY LEAD

After the pipeline runs, the system does not hand you a spreadsheet of names. It hands you a fully researched prospect, complete with their LinkedIn post that signaled intent, their company pain points, their verified contact details, and a personalized outreach draft written specifically for them. The goal was never volume. It was qualified, actionable leads.

Research Output

The system identifies company pain points, growth opportunities, and the exact engagement angle most likely to get a response.

Enriched Contact

Verified email and phone number pulled automatically, no manual searching across tools or databases.

Creative Assets

LinkedIn and WhatsApp drafts written using the prospect's own post content and company context, not a generic template.

Generation follows strategy, not prompts.

A SYSTEM PEOPLE CAN ACTUALLY USE

The backend runs complex multi-step automation. The experience is a single dashboard. A user enters a keyword, sets a date filter, and clicks one button. The scraping, profile research, company analysis, enrichment, and outreach drafting all happen automatically. No switching tools, no manual copy-pasting, no technical knowledge required.

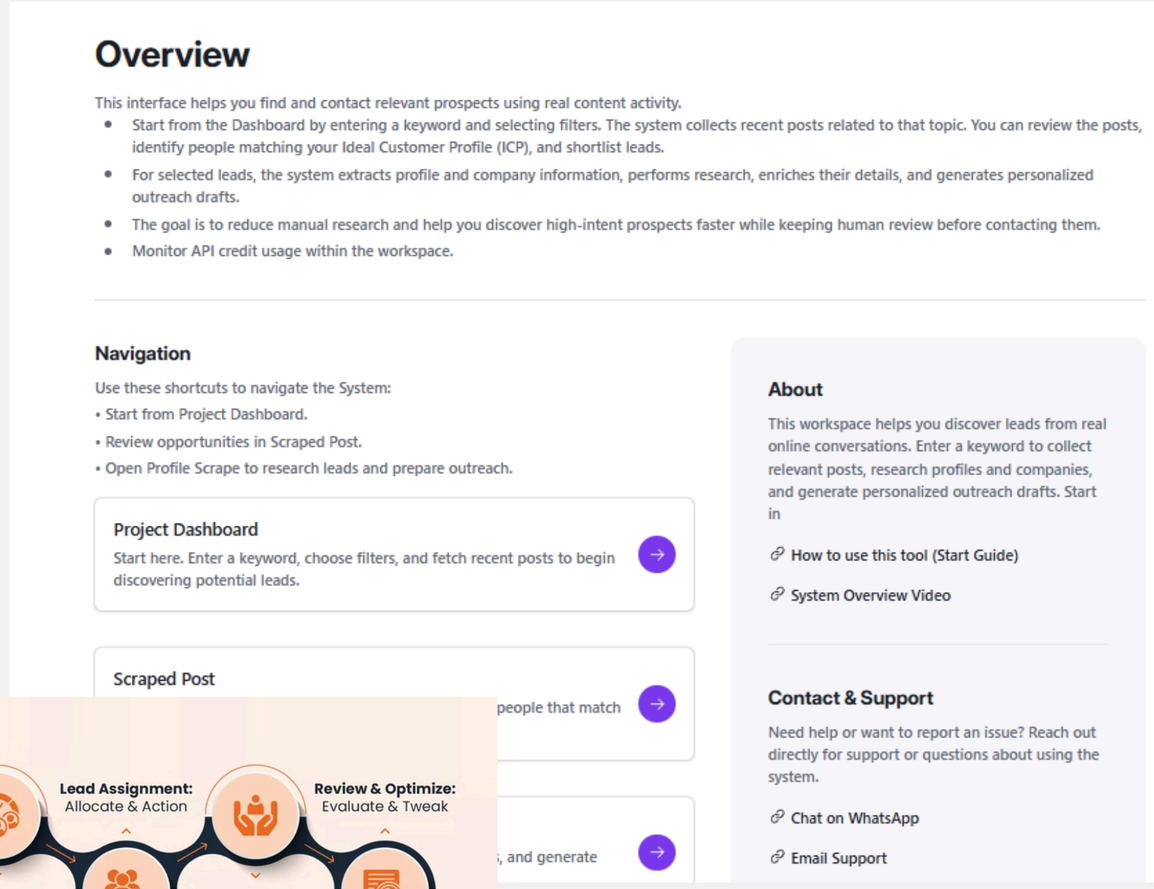

Keyword Input
Enter any intent-based keyword and select a date filter. The pipeline activates instantly.

Post and Profile Scraping
Relevant LinkedIn posts surface automatically along with the author's full profile data.

Enrichment
Verified email and phone number retrieved automatically using our integrated enrichment API.

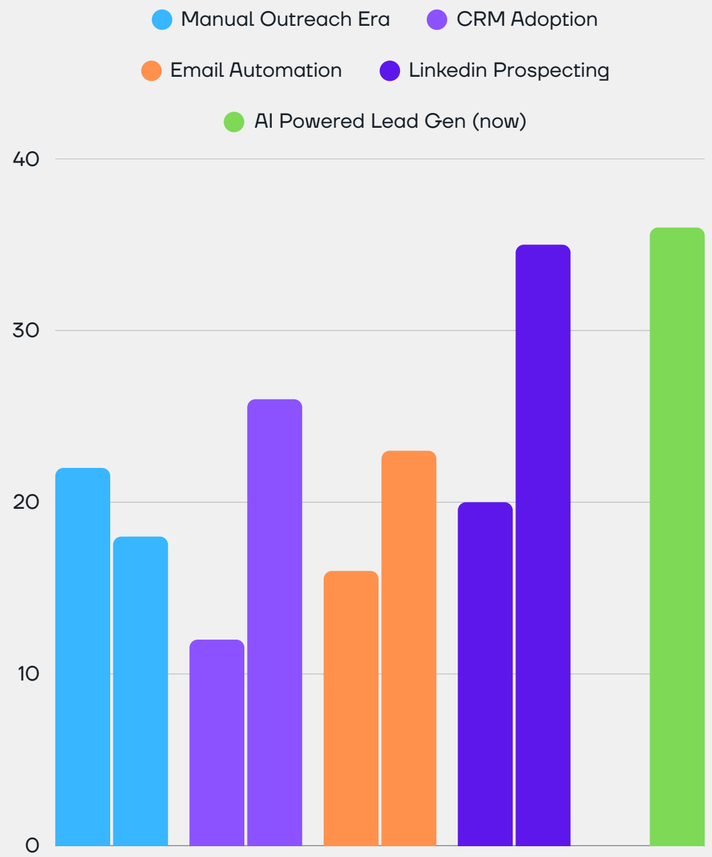

Outreach Generation
Personalized LinkedIn and WhatsApp drafts written using the prospect's post, company research, and identified pain points.

Good automation isn’t just powerful. It’s usable.

COMPETITVE ANALYSIS

Every existing tool solves one piece of the puzzle. Apollo finds contacts. Sales Navigator browses profiles. Hunter finds emails. ChatGPT writes messages. But none of them talk to each other, which means the sales rep becomes the pipeline, manually stitching tools together and losing hours in the process. The market is full of point solutions. Each one does one thing well and nothing else. The real cost is not the subscription fee. It is the hours lost being the glue between disconnected tools.

- Apollo gives you contacts with no context on why they would buy
- Sales Navigator lets you browse profiles but stops at discovery
- Hunter finds an email address with no knowledge of the company or pain point
- ChatGPT writes a message with no data behind it

They built tools. We built a pipeline that thinks.

THANK YOU.

AUTOMATED INFRASTRUCTURE

Most manual work isn’t necessary. It just hasn’t been systemized yet.
